

EMOTIONAL INTELLIGENCE PROJECT
INTERVIEW WITH
Judith Orloff

Q: What's all this about emotional intelligence? Ten years ago nobody was talking about it?

A: Well, ten years ago people were doing it and they weren't talking about it, because in business it was considered, um, dangerous to have emotions.
(OFFSTAGE)

A: Well, emotional intelligence is not new. It's been around for, forever. It's just that as our world became more industrialized and business became more formal, people felt that emotions were dangerous in the workplace. So the reason it's so, um, open, it's becoming open now is because the people that were the, uh, hippies in the, in the sixties are running businesses today. And I, I believe, personally, that they always have been emotionally intelligent. So now that they're in more powerful positions in, in organizations, I, I believe that people are taking emotions more seriously, and yet less seriously at the same time.

Q: A hundred years ago---
(OFFSTAGE)

Q: A hundred years ago people valued the strong silent type, the man of action. Were these skills important back then? Or have things changed in our human universe?

A: A, a long time ago, when, uh, John Wayne did "High," -- I think it was John Wayne that did "High Noon," I'm not sure it was him. But whoever, Gary Cooper did "High Noon."

A: A, a long time ago, when I was a kid and I was watching "High Noon" with Gary Cooper, I, I always thought he was sexy and attractive, 'cause he didn't say anything. And the men at that time were considered powerful and macho when they didn't cry, when they didn't— wh-when they were able to brush off death, and brush off serious issues by taking care of people. And I think even today, that's still valued

in, in, in a lot of areas. It's still valued in, in situations, particularly in business, uh, when there's a crisis to be had, and the person that can solve the crisis is not showing strong feelings. I think that's still very important. It doesn't mean they're not having them. There's an, an incredible difference between having a feeling and acting that feeling out, and who knows what Gary Cooper was really feeling? I mean he might have been terrified. But the way he dealt with his terror is what was appealing and attractive. He was able to do what he wa-- had to do no matter how he felt. And from my point of view, emotional intelligence includes Gary Cooper at "High Noon," 'cause it doesn't-- it means being able to keep your word, being able to do what you said you were going to do and create the results you were going to create, whether it's killing your opponent in front of the clock in the main street, or getting the results for the organization in terms of the profitability. No matter how you feel, and no matter what you feel, being able to continue doing what you said.

Q: Can you explain for the laymen what emotional intelligence is?

A: Emotional intelligence is, um...
(OFFSTAGE)

A: My de- My word for emotional intelligence is emotional literacy. Uh, I don't usually use the concept emotional intelligence. But emotional literacy is one's ability to be aware of what's going on inside, and focusing on that, rather than the other person or the situation. So once I'm aware of what I'm experiencing, it seems to give me more ability to know how to deal with whatever is going on around me. So emotional intelligence or emotional literacy is that capability to choose how to respond in any situation by knowing what's going on inside of me in that, in that moment.
(OFFSTAGE)

Q: Is there a difference between the way men and women deal with this question of emotional intelligence?

A: Um, can I say I love your question? I mean I, I love the question of the, of the gender differences in emotions and how men and women deal with emotions. I think that they deal with them outwardly differently, but they experience them the same inwardly. And I think that I, I am not sure whether there really is a genetic difference in capability of expressing emotions, but every man I've ever known wants to fix something. And, uh, and they love to fix things. I've never known a man that doesn't want to solve a problem right away, and do something about it.

They take action-- even if it's children, even if it's little kids of three and four years old. The little girl tends to want to play with something -- the little boy wants to take it apart and put it back together, very quickly. So I, I think that women have, um, the ability to express their emotions very differently than men do, in general. And I think that's wonderful. I, I just think it's wonderful. And I don't think being emotionally literate has anything to do with the way you feel emotions -- it's got to do with the way you express them, and it's got to do with the way you deal with situations. So I think cultural differences apply, whether it's people from Europe express them differently. Ethnic differences apply. Um, Mediterranean cultures express emotions much more openly than people from Connecticut in general. So I, I don't think there's... I, I think we have to... In, in order to be emotionally literate we have to really be able to accept how everybody expresses their emotions. Just everybody expresses them differently.

(OFFSTAGE)

Q: What are the myths or objections that you've heard about EI?

A: Well, in my work, the people I talk to that, uh, want to work with our organization love EI. And I haven't met anyone that is of any intelligence that doesn't think of it as common sense. I haven't met anyone that, um, I speak to on a regular basis, that isn't afraid that it means touchy-feely. I don't think it means anything like that. In fact, I think it's very different than what the general public might think of. For me it's being able to keep your word, and have your will take precedence over what your experience is. And that's very different than touchy-feely, and it, in terms of business, people want it as long as it doesn't interfere with getting results done. And most organizations that want E.I., uh, don't want to hear all the details about it. What they want is results -- results, results, results. So in terms of leadership, for instance, uh, every leader that I've ever spoken to in any company is already emotionally literate, if they're successful.

(OFFSTAGE)

Q: Give me some examples. How does a sensitivity to EI help in the business world?

A: I believe that the fastest change in our culture comes through business, because people can do things very quickly. Like we have a program where-- that can affect ten thousand people at a time. Those ten thousand people go home at night and they're different with their families. They might not kick their dog. They might not, um, beat their kid. They might be more patient with what their family

discussions are about. They might think more. They might take a walk at night and feel love instead of feeling angry at their boss, because they've learned how to understand firstly, what's going on inside of them. They've learned to transform what we call negative emotions into positive experiences and learning. And they've been able to have more peripheral vision. When, when a person gains more emotional intelligence it seems as if they get smarter. It seems as if their brain takes a new order, like a, like the theory of dissipated structure -- as the brain grows a new way, once people go through changes. And so we believe that business is welcoming it as long as it's in the context of their strategic, uh, initiatives that the business wants to accomplish. Our organization won't sell emotional intelligence products by themselves without having them be deeply enmeshed in the business processes and the business results, because then people will learn how to retain the knowledge for a long time.

Q: What do you say to a person to soften the blow when they are asked to take a course to heighten their EI?

A: I think line people are probably the easiest people we have ever worked with, to accept new ideas. I don't think we would ever go into an organization calling it, calling the, what we're doing E.I. We go into an organization saying we're going to create a re-engineer of the pro-- we're going to be re-engineering a process. And in order to be able to, to lead---
(OFFSTAGE)

A: We go into organizations, um, talking about the business results, which I've said a lot during this, this time, because we don't want to go in saying we're doing E.I. We want to go in saying that the way we're going to re-engineer a process is by teaching people new models of leadership. So in order to work in a process environment, you have to be able to communicate differently with your c-peers than if you're working in a functional environment. You have to be able to ask questions. You have to be able to take in new ideas. You have to be able to be synergistic. You have to be willing to let go of your belief system. So to shift that paradigm we're going to teach people new skills, and those skills are, are in leadership or in process redesign or in, um, in something that makes sense to what their work is. We, we do our very, very best to keep our language synonymous with what they do on an everyday basis.

Q: What would you tell a director of training who is not familiar with the EI approach?

A: That's different. That's a whole different story. The-- One-- Some of the most difficult situations we encounter is with people that have high level degrees in organizational development, in H.R., in training, people who are already successful in what they're doing. And that's where the rub usually is, 'cause those people are the people that could use the skills and learn them so quickly. But I'm not sure why the threat is so strong with, with, with professionals. Uh, that's where we find our most difficult, um, work to do is making sure that we treat them as the heroes and not us. Because H.R. has not been considered very valuable in many organizations, and so they don't have that much power. Many people-- this is a hard one. Let's stop for a minute.

(OFFSTAGE)

A: Please don't use the piece I just did on the H.R. Manager, or the H.R. Professional. We're going to try it again.

Q: You said there are certain people who are more resistant to this sensitivity?

A: When we work with, uh, line managers or, uh, people that have P&L responsibilities, putting emotional intelligence into the work we do is relatively easy. The most difficult job we have is making sure that the people that already are the trainers and the H.R. professionals, really understand what our intention is, and how we're going to implement what they need to have done in the organization, using a technology that they might not have learned yet. Once they're, uh, once they understand what that technology is, and how it can support what they're doing in an organization, it's not as difficult.

Q: What would you say to a CEO who's been successful for thirty-five years? Does he need to change?

A: A lot of people in, uh, a board room of organizations are very successful, and they don't really have a need for emotional intelligence, personally. What they do have a need for is to have their, um, leader, that they, their direct reports be able to accomplish the goals of the organization. So what we do when we talk in the board room is we give examples to the CFO, or the CEO. about what's going on in the lower levels of their organization that EI could support. We don't ask them to change because they're great the way they are. I mean why would they change if they've gotten where they are? There, there's no reason to. Some of the times that changes occurs (sic) are with, with, or when there is a merger and acquisition, when

two large organizations are merging, and the CEO of one, and the CEO of the other, or the CFO of one, and the CEO of the other, have to take new roles. That's when EI in the board room becomes very, very important. Other than that why bother when they're as successful as they are? We just want them to champion what's going on in their organization. We don't ask them to change unless they believe they have a need to change. People don't change unless they either, they see a need from within, a crisis occurs, they, they get cancer or they have a divorce, they lose their job, they, they have an epiphany of some sort. Uh, then they do something for themselves. Or, they're told, "You'd better make this change, or something quote bad will happen to you." Those are the only--- I mean why would people change unless there's a true need in their own mind? They own it, that it, it's good for them to do it. So that's, that's the tact we always take.

Q: Saying there's a need to change and implementing it aren't always the same thing.

A: Right. Um, I was at a, a con- at a client meeting, a design session about two weeks ago, uh, and the client said that she had heard a talk the night before, where a very famous person said, "The farthest distance in the world is between the mind and the heart." And so I, I love that expression. I, I was moved by it. Um, and I thought to myself, "Well, how do you move somebody's mind when they say I want this change, to their heart where they actually make the change occur? How do you make something that's intellectual, emotionally true? How do you make it heart-felt?" And we believe the way you do that is by creating cognitive dissonance. But I mean everybody has a point of view about everything. I mean even my thirteen year old, if you ask, he knows everything. He knows where, how everything works and he know, he has a point of view about why it works, and I'm sure everybody's thirteen year old does. So in order for me to want, have him want to change, I have to create confusion in his brain, so his old way is in competition with the new way. And how do you get a person to want to go the new way when it, when they're so immersed in the status quo? You have to create something at the end of that rainbow in the new way that means more to them and has more value to them than what they already have. So, that's how we use emotional intelligence in, in designing training, because people have to have that moment when the, the old way and the new way collide, and it's like a bang in the brain and all of a sudden there's "Okay, maybe I can do this." And then we create the new way to be more exciting, uh, and more powerful for them, that it has more personal value to them. So that's how we do it. I, I mean otherwise I don't see where an intellectual understanding of something can do more than a temporary es- like, it's like a temporary, uh, massage.

It's like a tranquilizer. It feels good at the moment, but it doesn't last. So in order to make it last you have to find the highway from the mind to the heart, and make that a quick highway, you know, a quick ride.

Q: How are organizations using EI successfully, from your experience?

A: I think that the organizations that us-- that are able to use EI successfully are those that are aware of what we call, um, the shadow side of their organization or the dark side of the organization. And they're able to see what the conflicts are. They're able to look them straight in the eye. They're able to look at them and see them and say, "Okay, this is what is. This is where we are. And here's where we want to go." And to be able to transform the anxiety the, the fear, the disappointment, the anger, to use it as a positive force to make change. And, and those organizations continually use it, and it's not just words, it's, it's, everybody in the organization is excited. There's buy-in. People can do it the way they believe is the right way. And they feel that they're empowered. That's just the beginning though, you know. I mean that's only a piece of really what I want to say. It got too heady.

Q: Focus in on narrower examples.
(OFFSTAGE)

A: We-- For example, our company's been working with a franchise organization that, um, from the very top, corporately to, to everyone in that franchise, to support them in making a paradigm shift. Now how do you make that happen when people are from different cultures? They're from different points of view. There's executives and there's mechanics and there's... I mean how do you do the same kind of work with different kinds of people who have different educations? So the way this organizations' been able to do it is by being authentic, by being honest, by dealing with all the conflicts -- they're right out front. And by allowing people to come to their own conclusions, rather than....
(OFFSTAGE)

Q: Talk about how this particular company saw the successful coalescing of different people coming together through EI.

A: We have the great mis-- the great fortune and privilege.

A: Our organization is privileged, uh, tremendously privileged and honored to work with a franchise organization in America that, um, has people from all different

places, different points of view, different historical backgrounds, different educational backgrounds. And they accepted our methodology as a way to go through the entire organization, whether it was a franchisee, um, the corporate person, um, the trainers, everyone in the organization. So they were willing to look at the issues straight on. They were looking at the conflicts between the franchisees and the corporate people. They were looking at people's differences. They were able to discuss it in an honest way. And so, so they were willing to take the anger, the disappointments, the, um, the-- well, the lack of education, whatever it might be. Look at it. Feel it. And transform it. Uh, they were able to train their managers to, uh, deliver the training to their own people, so we not only provided EI to the audience in terms of the top people, but we, we transferred the knowledge to them, to train their own people. So now it's in the organization. It's still in the process of being looked at to, you know, see how much it worked. We, we don't have a longitudinal study or anything like that yet, but we do know that when I see those people they love me and I love them. And I don't care who they are in the organization, but the-- if I've met them once, I feel like I've known them forever. And so to me it's the beginning of a success. We can't really report on the true success for a longer time.

Q: How does an organization approach the consultant? Does it require a smart executive who says "We've got problems here. I wonder if this approach might work?" Who is it that recognized something is amiss?

A: Um, um, I could speak of how we do, how we get some of our opportunities. Um, we do some marketing. People know about us. There's word-of-mouth. But somebody in the organization is yearning for something. Someone in the organization is anxious, is desperate for something to occur. They don't want to leave their organization -- they love their company -- but something is not working right. Those are the people that we talk to, whether it be a training director, an operations manager, uh, a CEO. It's, it's rarely a CEO that will approach us and say-- they usually send somebody to find out about us. So those people talk to many different consultants and many different organizations and they wait to see if they can find somebody who they feel safe with. And I think the minute they believe what the, what the consultant is saying, or the salesperson is saying, and they see it demonstrated rather than talked about, then the next step gets taken. But in, and with EI, unless it's demonstrated by the person who's trying to sell it, or trying to talk about it, how can anybody trust it?

Q: Is that because.....?

EMOTIONAL INTELLIGENCE PROJECT
INTERVIEW WITH JUDITH ORLOFF

Q: ... come from a background of the linear way – “we have statistics that prove this.” Is EI different enough from that kind of analysis that it requires some kind of special sensitivity in people to accept?

JO: We believe that most people respond to the unspoken words that people say. Words are only ten percent of a communication. I mean we all know that. Uh, ev-every communication theorist around has said seven to ten percent of every communication is words. The rest is what's under the words, what's behind the words, and I believe that everybody knows what people really intend when they speak. They might not know what it is. They might not know how to, what to call it. They might not even be able to talk about it. But they feel something inside of them, that then (sic) then say, "Well, you know what? This person means what they're saying." Or, "This person doesn't mean what they're saying." You can have all great statistics about every validi- validated study you've done or test you've done, but unless you can be what you're talking about it's pretty difficult to trust an E.I. person.

Q: Isn't there sort of a leap of faith for so much in life? People can present themselves.... At the beginning there's some kind of a magic bit of faith involved, mystery.

JO: One of the things that we believe distinguishes us is what we call our secret sauce. And our secret sauce, some people might call a leap of faith. Because if we're not real with our clients they're not going to buy from us. We, we, we-- I mean we know that. We've lost many sales because the sales people were talking about what we are, rather than demonstrating what we are. So I believe that there is a tr- a very big jump from, um, from distrust to trust. And when that jump occurs....

(OFFSTAGE)

JO: I don't want that previous response to be used.

Q: Would you say that emotional intelligence is basically a kind of maturity?

JO: Um, I, I, I think that children, from the time they're born, have emotional intelligence, and then they lose it as their parents teach them what the appropriate way to behave is. And they lose it because they have to to survive in their families. And I believe so many people are accepting emotional intelligence today because it's a mem-- they, they remember what it was like when they felt good. They remember what it was like when they could be who they really were. And we just have to learn how to be who we are, and not act it out. A lot of people believe that when you have a feeling, you should share it. And that was the eighties. Uh, and that was fun. I mean that was really fun, but a lot of it was very inappropriate. Uh, today, uh, we believe that we want you to have every feeling that's possibly available to humans, whether it be the most deep sadness and despair that you have at that moment, to the most joyful, wonderful, exhilarating, uh, experiences you could possibly imagine. However, we believe that as being a fair witness to those feelings it's what, is what, is what's relevant in emotional intelligence. Being able to see what you feel, take a look at it, experience it fully, and share what's appropriate in the situation, and to-- that may take the maturity. But being emotionally, uh, aware is not-- it doesn't take the maturity. It's knowing how to use the data from what you're experiencing in a situation for the highest good, that's what we believe takes the most maturity. And there's a lot of talk about people misusing emotional intelligence, so they can manipulate situations. We don't see that working very well, um, because once you're truly emotionally aware, it's very difficult to go against what you believe is the right thing to do. Very difficult.

Q: Is it ever possible, in the corporate world, to find a situation where there's an ethical conflict if you're using your emotional intelligence?

JO: Um, in, in corporate America people still believe, even those that tend to become emotionally literate that they have to be careful. And that may be true. And sometimes it, it does interfere with what you believe is right. And so what we have discovered that one-one of the benefits or non-benefits of growing emotionally in an organization is many people leave. If you become emotionally intelligent you might choose to do something else than stay in the, in the job you're in, because it might not be meaningful enough. We hope and we, we, we ask organizations to consider this very carefully, to allow people to share what's really true for them, and to make jobs more meaningful for people, because most people don't want to leave their jobs -- they want to be able to grow in their organizations, and they want to be heard. They want to be seen and heard and add value. We've never met

anyone that doesn't want to make a difference, ever, once they tell the truth about it. Everyone I know wants to make a difference, and that goes from the very bottom to the very top in organizations. The question is how does my wanting to make a difference interfere with your wanting to make a difference, and does that wanting to make a difference interfere with revenue and _____ needs? And how to bring that all together in a way that works. I think when we can do that, we won't be losing top talent. We'll be able to keep people and create career paths that are meaningful for them, rather than something that they feel they can't tolerate.

Q: Is there a flip side to that? Is there a way to spin it so that those people may in fact find their jobs more meaningful?

JO: A lot of people, once they learn to understand what's going on inside of them, how to deal with conflict better, how to transform situations into more positive, empathetic, sensitive situations, find that they have more value in their work, and find that they can grow better in their jobs, rather than leave. I think it all depends on who a person's manager is, and whether or not that manager's willing to also be intelligent emotionally. So we have a, uh, uh, an education process that is just beginning in corporate America. It's just beginning. We've only seen the tip of the iceberg. We've only seen emotional intelligence be accepted in very, uh, accept, in, in very avante----
(OFFSTAGE)

JO: We've seen emotional intelligence accepted in organizations like American Express, like Bank of America, like Fleet Bank, like Midas International, like Ford is beginning to and G.M., um, but in pieces, in parts, not all through the entire organization. It's going to take awhile before this is part of the mainstream culture.

Q: Is it inevitable that this will happen, do you think?

JO: Once, uh, Americ- Once people discovered fire, they didn't stop, uh, cooking. Uh, once people discovered that they could find a way to experience and use their emotions in an, in, in their lives so that they don't have to separate home from work, they feel more whole. Once humans feel more whole, it's going to be very difficult to take that away from them.

Q: Let's talk about what you were saying.

JO: One of the most valuable aspects of being emotionally intelligent is you-- it's uh-- Is once you understand what's going on inside of you, you could stop yourself in the middle of anything, just by will, and shift it to something that's going to be of more value to you and the people around you, and that skill is being able to come into the present moment and leave the past that you're reacting to, and come right here, right now, wherever you are, and deal with the situation as it needs to be dealt with, not as you used to deal with it. And we think that that, that skill in itself, will create more productivity, more, more love, even though that may not be ready to say that for the workplace, but certainly more loving feelings and more generosity of spirit and more courage. And that's what we think is needed for emotional intelligence to stick in the workplace. Many, many people like Eastman, uh, Mr. Eastman from Eastman Kodak, like Mr. Kellogg, that started Kellogg's, they started their businesses for their communities. They began their businesses so that the community would have a-- have something to work on that was meaningful, so that people would stay there. Those values we don't have very much in business today, and I believe emotional intelligence truly could bring them back to the workplace.

Q: Do we need to think about developing our emotional intelligence on a Monday, a Wednesday, Friday? Once a month? How do we approach this new idea of getting smarter?

JO: I, I, I think that once a person has an experience of total acceptance of themselves -- and some people call it unconditional love, some people call it other things, but I'm going to call it acceptance of themselves in that moment. Whatever that moment is, there's something that occurs that can't go backwards. I think that once we have that experience we begin to approach every situation, Mondays, Tuesdays, Wednesdays, Thursdays and Fridays, from that context in ourselves, because we feel so good. The benefit of being emotionally literate, as much as, as you can, and checking in with yourself to see how you're feeling and what that, how that is affecting you and the people around you, has a tremendous value for your health, for your personal life, and for your productivity, so why would anybody not want to do it all the time? It's not that difficult once you say, "Okay, I'm going to go for it." It's not difficult. It's just the getting there and, and the choosing to do it. The choice to do it means a change in how you're seen by yourself. It means a change in how you're going to be with other people. And the question is, are we willing to make that choice?

Q: Can we think of it as a learned behavior, sort of like learning to ride a bike? We're always going to know how to do it?

JO: I, I, I, I think emotional intelligence is both learned and remembered. There is, there are skills to it. There are tools that people have. We have some tools. We have a tool that helps people get to the present moment. We have a tool that ge- helps people get feedback. We have all kinds of tools. That's the learned part. But the remembered part is going back in time to when you were just yourself with your friends -- just yourself -- and you got together and you played ball and you won. And you don't know how you won, but you were synergistic. That's what we call it today. But you just were doing something and time went by and the day went by and you were just happy. And that's emotionally intelligent too. So I believe it's, it's a combination of remembered, um, of remembered moments in the present time, and skills that bring you back to those remembered moments.

(OFFSTAGE)

Q: Let's discuss that point we have to be careful to make.

JO: Um, we have to be... I think all of us have to know that every emotion that we have is ours, whether it be our deepest sadness or our rage that we can't explain, our, um, our unhappiness, our happiness, our joy. It doesn't matter what the emotions are, they belong to us, and we create them and we, we can, only we can make them disappear. So I think that is also part of emotional intelligence that's kind of coming to the forefront now. In the beginning we talked about emotional intelligence only in terms of certain positive emotions, and how to manage the negative ones. Uh, that still is true, and it's still very important, but we also have to remember that every emotion that anyone has, we have. That we have all of the range-- we want our range of emotions. We want them whatever they are, so that we can learn from them, we can experience them and use them for our everyday life.

(OFFSTAGE)

Q: You talked at the beginning about how different cultures may or may not emphasize emotional intelligence. In the workplace how can these very different kinds of people use EI to their benefit?

JO: All of us are brought up differently, and we're all product-- we're all the product of how we were brought up, as well as our culture and our history, and our parent's history etcet--- and our, our nationality's history. Um, as

long as we're aware of what's going on inside of us, we will tend to know how to behave with what's going on around us. So for instance if I'm in Japan and I'm a very effervescent type of person, and the Japanese people are very resp- uh, very quiet and v- and very respectful in the way they behave, and they don't share much of their emotions in general, I could feel judgmental. I could feel uncomfortable. Or I could feel like myself, and I could be with them no matter how they are, as long as I'm aware of what's going on inside of me. Because if I didn't know I was uncomfortable I might say they were being cold. If I wasn't aware of what was going on inside of me I might say they were being mean. I might say they didn't like me. I might make up all kinds of stories. But if I'm emotionally intelligent and I'm aware that I feel uncomfortable in this new culture, then I might just stay with my discomfort until it disappeared and until I felt like I was aware I could deal with what was going on around me. And that makes a big difference, 'cause I think being emotionally intelligent, eventually, will create people giving up judgments of other people and the way they do things. That's my hope.

(OFFSTAGE)

Q: How should an approach to EI be implemented in the workplace?

JO: Well, one of the ways we're, we're implementing E.I. in a, in a multinational bank...

(OFFSTAGE)

JO: One of the ways we're implementing EI in a very large, uh, organization is through their management training. We're developing three levels of management training. One is for beginning managers. One is for functional managers. And another is for business managers. So the entire group of people get together for a design session, and we make sure we get all of their strategic needs in that design session. We understand their culture, and we take the essential elements of their culture and their values and we weave that into every management module that we're doing for that organization. Then we teach them how to deliver it to their own people. So what they want in that organization is respect, integrity and trust and personal responsibility, no matter who the manager is. Those were the four qualities that they asked us to make sure are implemented throughout their entire organization. So imagine that no matter what the training is, whether it's reading financial statements or it's, uh, empowering others, or delegating, or, uh, planning, or time management, that trust, personal responsibility, respect and integrity are part of what the manager is learning with

everything. So that's one way of implementing it. Another way is through the web, in follow-up. I mean this organization also will be doing a, a pre-assessment on the web and then modules that follow on a regular basis that are, that are, that are web-based for years, I'm imagining. So that the manager that, uh, has done the two or three day face-to-face training, then can follow their own development and their growth by, by, by going on the web and seeing what's available in their own organization. So that's one method of implementation. Uh, I'm sure there are others, but, but this is taking all management levels and making sure that everybody has the same, the same information.

Q: Have you found that there are certain kinds of industries that either need more EI sensitivity or naturally have EI sensitivity?

JO: Um, there are certain industries that, uh, because of the way the workforce operates, are, and because of the size of them, and, and the mammoth size of them, uh, have, have much more, um, dispersed populations, so it would be very difficult for those organizations to begin to have an implementation of EI easily. There are others where it's more in one place, or, or, or people are consultants that are-- it, it would make it easier. We think that the industries of energy...

(OFFSTAGE)

Q: What about a company with thirty thousand people in a workforce?

(OFFSTAGE)

Q: It's true that a thirty thousand person workforce is a tough nut to crack....

JO: Um, an industry like Burlington Northern...

JO: Any industry that has a safety issue would be a wonderful industry to implement emotional intelligence, 'cause why are there safety issues in industries? Um, maybe because people are tired. Maybe because people aren't thinking clearly. With emotional intelligence we believe that the safety incidents would go down. There'd be more safety because people would be more aware. The, the, the biggest benefit of emotional intelligence, right off the top, is awareness, self-awareness. I can't imagine any industry that wouldn't benefit from people being self-aware. I can't imagine any industry that wouldn't benefit from people having respect for each other. So if you
