Thank you! Your feedback is important to help us ensure the high quality of our program.

Reflective Learning Journal

Session ____ Day ____

What new theories and concepts did you learn?

What theme in your life was evoked?

What emotions were evoked?

What was funny?

What did you discover about your Self?

**Did you have an experience of being in paradox?
What was was it?**

Transformation

What behaviors did you demonstrate in the group?

What were the results?

What was your context for learning today?

What mistakes did you make?

What did you learn from your mistakes?

In what way is this information personally valuable to you?

What will the results in your life look like when you have applied this new information?

What will you have to do to learn it?

Transformation

How will you know you have learned and applied this new information?

What was your experience of learning?

What were some of the key points?

What practical applications can you make with what you learned?

In your life?

In your work?

***Go deeper.* Let yourself feel, know see everything about yourself during this learning. What new information can you let yourself know about you?**

Transformation

After you have reflected, filled out this journal, taken a walk, and emptied your mind, see if the tension between the old and the new information relaxes into a new level of knowing. If so, what is it?

What learning are you personally responsible for today?

Transformation

ETP II Transformation

Interpretation and Projection

Interpret: To explain to oneself the meaning of.

When we have physical sensations, we call them a feeling. Then we put a value on that feeling (good or bad). And then we cover all that with a thought about the value of our feeling, e.g. "I don't care!" **That value and thought are our interpretations of the experience we are having.** This was true for our parents and their parents also.

We interpret our sensations the same way our families did. If our family called a sensation of fluttering in our stomach "fear", then so do we. But if our family called that same fluttery sensation "excitement", we do, too. We have the same judgement or value attached to "fear" that they did, unless, as we grow in our lives, we consciously decide to shift our context.

It's rare for anyone to just experience sensations without labeling them. We all do it automatically until we choose to know the truth of our experience rather than our thought or interpretation of it.

Any meaning that we give to an experience that separates us from that experience, usually in the form of a judgement or being right, is an interpretation.

Projection: Unconscious attribution of one's own feelings, attitudes, or desires to others.

When we are children we all project. Everything we see is based on our experience of not being separate from our parents. For example, as a little child we thought that if we closed our eyes, our parents couldn't see us. Conversely, when our parents wanted us to be any certain way, they projected their desires on us, and because we didn't experience ourselves as separate, those desires became our own. We have no other option until 5 years old or so when we begin to experience ourselves as separate from our parents.

As an adult, projection is giving our energy and power away by thinking that we are behaving the way we do because someone else wants us to. Even if they do want us to! Or thinking that someone else is feeling what we are feeling. We do this because we don't want to see ourselves or be responsible for our experience. Projection is a way of refusing to leave our childhoods.

Any judgement of anyone or anything outside ourselves is a projection.

To discover how you project:

Tell yourself what behaviors you do that you would never do if it weren't for other people.

Tell yourself what feelings or thoughts you have that are about someone else.

The Human Aura

taken from "Color Healing"
by Mary Anderson

The earth and all its inhabitants obtain energy from the sun's rays - all elements known on earth are found in the sun, as shown by spectroscopic analysis. White light contains the energies of all elements and chemicals found in the sun. The sun is constantly pouring white light energy into the atmosphere, thus 'charging' this atmosphere with the different types of energy necessary to sustain life.

Man has an auric body surrounding and interpenetrating his physical body. One of the functions of the aura (the electro-magnetic field which surrounds everything) is to absorb the white light energy from the atmosphere and split it into component color energies, which then flow to the different parts of the body to vitalize them.

Esoteric science gives a man a sevenfold nature of subtle bodies and the aura is the expression of that nature. The teaching is that man has not only got a physical body, but that he has, so to speak, a foot on other planes of being beyond the physical.

The seven aspects of man are not separate states distinct from one another, but are currents of thought and feeling within the whole ocean of consciousness, and often overlap. Man then is a more complex creature than orthodox science allows or knows, for potentially he has these seven aspects which make up his complete being, but of course many people at present experience very little development on the higher vehicles.

The sevenfold division of man's nature is usually classified in the following levels of consciousness:

- 1) Physical Etheric Plane
- 2) Astral Plane
- 3) Lower Mental Plane
- 4) Higher Mental Plane

- 5) Spiritual Causal Plane
- 6) Intuitional Plane
- 7) Divine or Absolute Plane

Man being--as the Ancient Wisdom has always contended--a septenary being, the auric emanation consists of seven distinct units or waves of light, encircling the subject in an oval-shaped conformation. The extent and strength of the aura varies considerably from person to person, depending on his state of health, mental and emotional state, and his evolutionary status.

The first aura is the one emanating from the physical etheric body and it is this cloud-shaped formation that most people see first when they practise seeing the aura. Its base is the center of the spine. The etheric body, the vital counterpoint of the physical, is important as it draws in the prana, or life energy from the atmosphere and distributes it through the system. In a healthy body the first aura radiates outwards in straight regular lines from the body's center. In disease these lines are seen to droop, rather like bent lightning conductors.

The second aura emanates from the astral, or emotional center in the spleen, and encircles the astral body, extending about twelve to eighteen inches from the body. Every change of thought or emotion causes a change in this aura. It vibrates and changes continually. In harmony, it should be bright and luminous, showing emotional balance.

The third aura is the expression of man's intellectual make-up and its strength depends upon the development of his faculties, which in turn partly depends on the education he has enjoyed. It is oval, emitting a radiant pale yellow color as it develops. In the intelligent, well balanced person, the aura is bright and shiny, but where the mind is depraved there are dark spots which dull its brightness.

The fourth aura is the emanation of man's higher mind or soul principle. Its color tone is green. Here we have the realm of imagination, inspiration and intuition, of creativity in art and literature.

The fifth aura interpenetrates the foregoing auras. This aura manifests the essence of spirit in man. Occult science teaches us that conditions in the lower forms of consciousness are the result of forces within the spiritual body. It is the receiving station for all the doings of the lower aspects and records the impressions received by them.

The fifth aura is the most important, for it is the point of union between the cosmos and the individual. There exists a delicate band between individual life and the ocean of consciousness shared by all.

The sixth and seventh auras are higher ones belonging rather to cosmic aspects than to individuals in particular. The average man has just not developed that high, and these auras would only be seen around the bodies of initiates and masters.

EXERCISE: Ask a friend to stand with a light behind him and against a light-colored wall. It is often easier to see the aura by not looking at it directly, but by concentrating on some point on the person's body. Then gradually you will see the faint glow around the head first and then around the whole body. To some people the aura appears to be white at first, but with practice, the colors will appear. The colors all relate to actual changes which take place in the electro-magnetic field due to changes in our emotions.

Theory of Dissipative Structures

Condensed from *The Aquarian Conspiracy* by Marilyn Ferguson

Darwin's theory of evolution by chance mutation and survival of the fittest has proven hopelessly inadequate to account for a great many observations in biology. Just as inadequacies in Newton's physics led Einstein to formulate a shocking new theory, so a larger paradigm is emerging to broaden our understanding of evolution.

Darwin insisted that evolution happened very gradually. Steven Jay Gould, a Harvard biologist and geologist, notes that on the eve of the publication of *The Origin of Species*, T. H. Huxley wrote Darwin, promising to battle on his behalf but warning that he had burdened his argument unnecessarily by this insistence.

Darwin ignored problems in his own evidence. True, there seemed to be great gaps, missing rungs in the ladder of evolution, but he believed these were just imperfections in the geological record. Change only *seemed* abrupt. But to this day fossil evidence has not turned up the necessary missing links.

Younger scientists, confronted by the continuing absence of such missing links, are increasingly skeptical of the old theory. "The old explanation that the fossil record was inadequate is in itself an inadequate explanation," said Niles Eldredge of the American Museum of Natural History.

Soviet paleontologists have proposed a theory that is consistent with the geological record. *Punctationalism* or *punctuated equilibrium* suggests that the equilibrium of life is "punctuated" from time to time by severe stress. If a small segment of the ancestral population is isolated at the periphery of its accustomed range, it may give way to a new species. Also, *the population is stressed intensely because it is living at the edge of its tolerance*. "Favorable variations spread quickly," Gould said. "Small peripheral isolates are the laboratory of evolutionary change."

Transformation

to the cell in the first place. Some equally elegant process may alter those instructions.”

He rejected the idea that random mutations account for the sophistication in living matter. Biological reactions are chain reactions, and the molecules fit together more precisely than the cogwheels of a Swiss watch. How, then, could they have developed by accident?

Evolution involves true transformation, re-forming of the basic structure, and not mere adding on.

Physicist John Platt has proposed that humankind is now experiencing an evolutionary shockfront and “may emerge very quickly into coordinated forms such as it has never known before... implicit in the biological material all along, as surely as the butterfly is implicit in the caterpillar.”

THE SCIENCE OF TRANSFORMATION

When the puzzles and paradoxes cry out for resolution, a new paradigm is due. Fortunately, a deep and powerful new explanation for rapid evolution - biological, cultural, personal - is emerging.

The theory of dissipative structures won the 1977 Nobel prize in chemistry for a Belgian physical chemist, Ilya Prigogine. This theory may prove as important a breakthrough to science in general as the theories of Einstein were to physics. It bridges the critical gap between biology and physics - the missing link between living systems and the apparently lifeless universe in which they arose.

It explains “irreversible processes” in nature - the movement toward higher and higher orders of life. Prigogine, whose early interest was in history and the humanities, felt that science essentially ignored time. As Prigogine keeps saying, there are many aspects of time: decay, history, evolution, the creation of new forms, new ideas. Where in the old universe was there room for *becoming*?

chemical reactions) are dissipative structures. A dissipative structure might well be described as a *flowing wholeness*. It is highly organized but always in process.

Now think about the meaning of the word *complex*: braided together. A complex structure is connected at many points and in many ways. The more complex a dissipative structure, the more energy is needed to maintain all those connections. Therefore it is more vulnerable to internal fluctuations. It is said to be "far from equilibrium." (In the physical sciences, equilibrium does not mean healthy balance. It refers to ultimate random dispersal of energy. This equilibrium is a kind of death.)

Because these connections can only be sustained by a flow of energy, the system is always in flux. Notice the paradox; the more *coherent* or intricately connected the structure, the more unstable it is. Increased coherence means increased instability! *This very instability is the key to transformation.* The dissipation of energy, as Prigogine demonstrated by his elegant mathematics, creates the potential for sudden reordering.

The continuous movement of energy through the system results in fluctuations; if they are minor, the system damps them and they do not alter its structural integrity. But if the fluctuations reach a critical size, they "perturb" the system. They increase the number of novel interactions within it. They shake it up. The elements of the old pattern come into contact with each other in new ways and make new connections. *The parts reorganize into a new whole. The system escapes into a higher order.*

The more complex or coherent a structure, the greater the next level of complexity. Each transformation makes the next one likelier. Each new level is even more integrated and connected than the one before, requiring a greater flow of energy for maintenance, and is therefore still less stable. To put it another way, flexibility begets flexibility. As Prigogine said, at higher levels of complexity, "the nature of the laws of nature changes." Life "eats" entropy. It has the potential to create new forms by allowing a shake-up of old forms.

At first the idea of creating new order by perturbation seems outrageous, like

Transformation

Aharon Katchalsky, also a physical chemist, had been studying dynamic patterns of brain function for many years. He was trying to understand how the brain integrates, what its rhythms and oscillations mean.

The brain seemed a perfect example of a dissipative structure. It is the ultimate in complexity. It is characterized by form and flow, interaction with the environment, abrupt shifts, sensitivity to being perturbed. It demands the lion's share of the body's energy - with only 2 percent of the body weight, it consumes 20 percent of the available oxygen. The ups and downs of its energy influx are characteristic of the unstable dissipative structure.

In 1972 Katchalsky organized a spring work session of top brain scientists at Massachusetts Institute of Technology to introduce Prigogine's recently advance theory to neuroscience. Katchalsky also presented his own cumulative evidence of dynamic organizing properties in nature and how they are affected by sudden, sharp fluctuations.

The theory of dissipative structures might well tie dynamic brain patterns to transitions in the mind. "The restructuring of an individual personality may take a sudden form, as in flashes of understanding, learning a new skill, falling in love, or the conversion experience of St. Paul."

At the same session, Vernon Rowland of Case Western Reserve University predicted that this approach to the brain would penetrate the old mystery: the difference that makes a whole more than the sum of its parts. Cooperation seemed to be a key; the more complex a system, the greater its potential for self-transcendence.

Brainwaves reflect *fluctuations of energy*. Inward attention generates a larger fluctuation in the brain. *These fluctuations then reach a critical level, large enough to provoke the shift into a higher level of organization.*

Memories, including deeply entrenched patterns of behavior and thought, are dissipative structures. They are patterns of forms stored in the brain. Remember that *small* fluctuations in a dissipative structure are suppressed
